The students of B.Sc (Hons. School) have also to study the subject of “Environment & Road Safety Education”. This is a compulsory qualifying paper which the students are required to qualify in the 1st/2nd/3rd year of the course. The examination will be conducted by the University.

Internal assessment and end semester examination will be of 20% and 80%, respectively of the total marks.

ENVIRONMENT AND ROAD SAFETY EDUCATION

UNIT I (ENVIRONMENT) (25 hr. course)

1. **Environment Concept**:
   Introduction, concept of biosphere—lithosphere, hydrosphere, atmosphere; Natural resources—
   their need and types; principles and scope of Ecology; concepts of ecosystem, population,
   community, biotic interactions, biomes, ecological succession.

2. **Atmosphere**:
   Parts of atmosphere, components of air; pollution, pollutants, their sources, permissible limits,
   risks and possible control measures.

3. **Hydrosphere**:
   Types of aquatic systems. Major sources (including ground water) and uses of water, problems
   of the hydrosphere, fresh water shortage; pollution and pollutants of water, permissible limits,
   risks and possible control measures.

4. **Lithosphere**:
   Earth crust, Soil—a life support system, its texture, types, components, pollution and
   pollutants, reasons of soil erosion and possible control measures.

5. **Forests**:
   Concept of forests and plantations, types of vegetation and forests, factors governing vegetation,
   role of trees and forests in environment, various forestry programmes of the Govt. of India,
   Urban forests, Chipko Andolan.

6. **Conservation of Environment**:
   The concepts of conservation and sustainable development, why to conserve, aims and
   objectives of conservation, policies of conservation; conservation of life support systems—soil,
   water, air, wildlife, forests.

7. **Management of Solid Waste**:
   Merits and demerits of different ways of solid waste management—open, dumping, landfill,
   incineration, resource reduction, recycling and reuse, vermicomposting and vermiculture, organic farming.

8. **Indoor Environment**:
   Pollutants and contaminants of the in-house environment; problems of the environment
   linked to urban and rural lifestyles; possible adulterants of the food; uses and harms of plastics
   and polythene; hazardous chemicals, solvents and cosmetics.

9. **Global Environmental Issues**:
   Global concern, creation of UNEP; Conventions on climate change, Convention on biodiversity;
   Stratospheric ozone depletion, dangers associated and possible solutions.

10. **Indian Laws on Environment**:
    Indian laws pertaining to Environmental protection: Environment (Protection) Act, 1986;
    General information about Laws relating to control of air, water and noise pollution. What to
    do to seek redressal.
11. **Biodiversity:**
What is biodiversity, levels and types of biodiversity, importance of biodiversity, causes of its loss, how to check its loss; Hotspot zones of the world and India, Biodiversity Act, 2002.

12. **Noise and Microbial Pollution:**
Pollution due to noise and microbes and their effects.

13. **Human Population and Environment:**

14. **Social Issues:**
Environmental Ethics: Issues and possible solutions, problems related to lifestyle, sustainable development; Consumerisms and waste generation.

15. **Local Environmental Issues:**
Environmental problems in rural and urban areas, Problem of Congress grass & other weeds, problems arising from the use of pesticides and weedicides, smoking etc.

**Practicals:**
Depending on the available facility in the college, a visit to Vermicomposting units or any other such non-polluting eco-friendly site or planting/caring of vegetation/trees could be taken.

*Note: Above 15 topics to be covered in 25 hour lectures in total, with 2 lectures in each topics from 2 to 11 and one each for the topics 1 and 12 to 15.*

**UNIT II (ROAD SAFETY)**

1. Concept and Significance of Road Safety.
2. Role of Traffic Police in Road Safety.
4. Traffic Signs.
5. How to obtain Driving License.
7. Common Driving mistakes.
8. Significance of First-aid in Road Safety.
9. Role of Civil Society in Road Safety.

**Examination Pattern:**

- Seventy multiple choice questions (with one correct and three incorrect alternatives and no deduction for wrong or un-attempted question).
- The paper shall have two units: **Unit I (Environment) and Unit II (Road Safety).**
- Unit I shall comprise of 50 questions with minimum of 2 questions from each topics 1, and 12 to 15 and minimum of 4 questions from topics 2 to 11.
• Unit II shall comprise of 20 questions with minimum of 1 question from each topics 1 to 10.
• The entire syllabus of Unit I is to be covered in 25 hours and that of Unit II is to be covered in 10 hours.
• All questions are to be attempted.
• Qualifying Marks 33 per cent i.e. 23 marks out of 70.
• Duration of examination : 90 minutes.
• The paper setters are requested to set the questions strictly according to the syllabus.

**Suggested Readings**

2. Road Safety Signage and Signs (2011), Ministry of Road Transport and Highways, Government of India.

Outlines of tests syllabi and courses of reading for B.Sc. (Honours School) First Year  
English Subsidiary (Semester System)

FIRST SEMESTER

Objectives:

The objective of teaching English to the science students is to create general awareness among them about literature and its impact on their lives. At the same time, it is expected that the students, on reading this course, shall develop proficiency in reading and writing skills, while acquiring a sensitive and analytical attitude towards literature in particular, and life in general. It is with this aim in mind that the new text has been selected and it is hoped that the objectives of the course will not only be reflected but also realized through necessary shift in the teaching practices, design of the question paper and mode of evaluation.

Note:

(i) There will be one paper of 80 marks, 10 marks are reserved for the Internal Assessment and 10 for the Practical Work. Total is 100.

(ii) The paper shall consist of Two Units. Unit I will be text specific and Unit II shall deal with different aspects of communications and language learning skills.

(iii) For Unit I, the prescribed text is Varieties of Expression, Ed. A. H. Tak, Foundation Books, which shall replace the existing text Patterns in Prose by Jagdish Chander, P.U., Chandigarh. It may be pointed out here that only certain sections of this text i.e. prose and drama are prescribed. Poetry has been deleted completely. Only five prose and five plays have been recommended for the study. The relevant sections, however, are as follows:

Prose:

I. The Judgement Seat of Vikramaditya, Sister Nivedita  
II Engine Trouble, R. K. Narayan  
III The Conjurer’s Revenge, Stephen Leacock

Drama:

I The Rising of the Moon, Lady Gregory  
II Waterloo, Arthur Conan Doyle

(iv) No text book is recommended for Unit II, but a few books that may be used for this Unit are listed towards the end Unit II shall consist of the following:

Communication: It shall focus on different aspects of communication, types of communication, and significance of positive attitude in improving communication.

Writing Skills: This section shall focus on précis-writing, letters of all kinds; curriculum vitae, short, formal reports (no exceeding 200 words); public notices and advertisements relating to product promotion etc.,

Modern Forms of Communication: Here special emphasis shall be given to teaching the format of e-mails, fax messages, telegrams, audio-visual aids and power-point presentations. Apart from this, the students shall also be given basic lessons in effective listening, non-verbal communication, how to prepare for an interview and group discussion etc.
Practical work:-
Teacher should assign some project or practical work to the students. This should be in the nature of guided activity, which the students shall have to complete under the direct supervision of the teacher. The students may be given projects on a variety of subjects relating to their discipline i.e. science in general or a specific area of science they are specializing in. Preferably, they should be given minor projects (to be completed within less than two weeks, and length not exceeding 20 pages) in consultation with teachers of science. However, the evaluation of the projects should be done only by the Language Teachers, who must keep all the basic criteria of good writing in mind while doing so.

Note: In case of private candidates and students of School of Open Learning, the marks obtained by them out of 80 will be proportionately increased out of 100.

Testing Scheme:
The examination paper shall be divided into two sections, corresponding to two units already proposed in the syllabus. The distribution of questions and marks in Section I shall be as follows:

Section I (It is text-based and corresponds to unit I in the syllabus)

Q1. It shall consist of five short questions (not exceeding 100-120 words) out of which a student will be expected to attempt any three. This question shall be based upon the prescribed text Varieties of Expression and cover a wide range of issues, topics and problems. It shall consist of 12 marks.

Q2. It shall consist of two long questions (not exceeding 300-350 words) out of which a student will be expected to attempt only one. This question shall have internal choice, be based upon the prescribed text Varieties of Expression. This shall carry 10 marks.

Note: The question 1 & 2 should be so designed as to cover all the chapters prescribed, as well as the major issues and problems listed therein.

Q3. It shall consist of an Unseen Passage for Comprehension (not more than 800 words), with minimum six questions at the end. These questions should be designed in such a way that we are able to test a student’s comprehension ability, language/presentation skills and vocabulary etc. This question shall be of 12 marks.

Q4. It shall exclusively be a test of vocabulary, but designed strictly on the lines of various exercises given at the end of each chapter in the prescribed text. The candidate shall be given six words in one column and asked to match them with words/meanings in the next column. This shall carry 6 marks.

Section II (Based upon Unit II)

Q5 (a) The students shall be asked to write a short survey report on a situation, incident, problem of science or the possibility of starting a new scientific venture (in about 150-200 words). The students shall be given an internal choice in this question. This question shall carry 8 marks.

(b) This question shall be on notices/advertisements of various types (as mentioned in the syllabus). It’ll carry 4 marks.
Q.6. This question shall test a student’s ability to write letters of various kinds (in nor more than 250 words). Again, there will be internal choice here and the question will be of 8 marks.

Q.7. There will test a student’s ability to write a Précis. A passage of about 200 words shall be given and the students shall have to write a précis of about 70 words (including the title). This question shall carry 10 marks.

Q.8. This question shall test a student’s understanding of various aspects of communication and modern forms of communication. It shall be divided into two parts:
   (a) Two short questions to be attempted (in not more than 100-120 words each) on different aspects of communication. It’ll carry 6 marks.
   (b) Definitions/format of modern forms of communication to be tested. This shall again carry 4 marks.

SECOND SEMESTER

Objectives:
The objective of teaching English to the science students is to create general awareness among them about literature and its impact on their lives. At the same time, it is expected that the students, on reading this course, shall develop proficiency in reading and writing skills, while acquiring a sensitive and analytical attitude towards literature in particular, and life in general. It is with this aim in mind that the new text has been selected and it is hoped that the objectives of the course will not only be reflected but also realized through necessary shift in the teaching practices, design of the question paper and mode of evaluation.

Note:
(i) There will be one paper of 80 marks, 10 marks are reserved for the Internal Assessment and 10 for the Practical Work. Total is 100.
(ii) The paper shall consist of Two Units. Unit I will be text specific and Unit II shall deal with different aspects of communications and language learning skills.
(iii) For Unit I, the prescribed text is *Varieties of Expression*, Ed. A. H. Tak, Foundation Books, which shall replace the existing text *Patterns in Prose* by Jagdish Chander, P.U., Chandigarh. It may be pointed out here that only certain sections of this text i.e prose and drama are prescribed. Poetry has been deleted completely. Only five prose and five plays have been recommended for the study. The relevant sections, however, are as follows:

**Prose:**
   I  J. C. Bose, *Aldous Huxley*
   II  The Position of Women in Ancient India, *Padmini Sen Gupta*

**Drama:**
   I  *The Proposal*, Anton Chekhov
   II  *Riders to the Sea*, J. M. Synge
   III  *Lithuania*, Rupert Brooke
(iv) No text book is recommended for Unit II, but a few books that may be used for this Unit are listed towards the end. Unit II shall consist of the following:

*Communication:* It shall focus on different aspects of communication, types of communication, and significance of positive attitude in improving communication.

*Writing Skills:* This section shall focus on précis-writing, letters of all kinds; curriculum vitae, short, formal reports (no exceeding 200 words); public notices and advertisements relating to product promotion etc.,

*Modern Forms of Communication:* Here special emphasis shall be given to teaching the format of e-mails, fax messages, telegrams, audio-visual aids and power-point presentations. Apart from this, the students shall also be given basic lessons in effective listening, non-verbal communication, how to prepare for an interview and group discussion etc.,

*Practical work:* -
Teacher should assign some project or practical work to the students. This should be in the nature of guided activity, which the students shall have to complete under the direct supervision of the teacher. The students may be given projects on a variety of subjects relating to their discipline i.e. science in general or a specific area of science they are specializing in. Preferably, they should be given minor projects (to be completed within less than two weeks, and length not exceeding 20 pages) in consultation with teachers of science. However, the evaluation of the projects should be done only by the Language Teachers, who must keep all the basic criteria of good writing in mind while doing so.

**Note:** In case of private candidates and students of School of Open Learning, the marks obtained by them out of 80 will be proportionately increased out of 100.

**Testing Scheme:**
The examination paper shall be divided into two sections, corresponding to two units already proposed in the syllabus. The distribution of questions and marks in Section I shall be as follows:

**Section I (It is text-based and corresponds to unit I in the syllabus)**

Q1. It shall consist of *five* short questions (not exceeding 100-120 words) out of which a student will be expected to attempt any three. This question shall be based upon the prescribed text *Varieties of Expression* and cover a wide range of issues, topics and problems. It shall consist of **12 marks**.

Q2. It shall consist of *two* long questions (not exceeding 300-350 words) out of which a student will be expected to attempt only one. This question shall have internal choice, be based upon the prescribed text *Varieties of Expression*. This shall carry **10 marks**.

**Note:** The question 1 & 2 should be so designed as to cover all the chapters prescribed, as well as the major issues and problems listed therein.

Q3. It shall consist of an *Unseen Passage for Comprehension* (not more than 800 words), with minimum six questions at the end. These questions should be designed in such a way that we are able to test a student’s comprehension ability, language/presentation skills and vocabulary etc. This question shall be of **12 marks**.
Q.4. It shall exclusively be a test of vocabulary, but designed strictly on the lines of various exercises given at the end of each chapter in the prescribed text. The candidate shall be given six words in one column and asked to match them with words/meanings in the next column. This shall carry **6 marks**.

Section II (Based upon Unit II)

Q.5 (a) The students shall be asked to write a short survey report on a situation, incident, problem of science or the possibility of starting a new scientific venture (in about 150-200 words). The students shall be given an internal choice in this question. This question shall carry **8 marks**.

Q.5 (b) This question shall be on notices/advertisements of various types (as mentioned in the syllabus). It’ll carry **4 marks**.

Q.7 There will test a student’s ability to write a Précis. A passage of about 200 words shall be given and the students shall have to write a précis of about 70 words (including the title). This question shall carry **10 marks**.

Q.8 This question shall test a student’s understanding of various aspects of communication and modern forms of communication. It shall be divided into two parts:

(a) Two short questions to be attempted (in not more than 100-120 words each) on different aspects of communication. It’ll carry **6 marks**.

(b) Definitions/format of modern forms of communication to be tested. This shall again carry **4 marks**.

Suggested Reading:

PHYSICS SYLLABUS FOR B.SC. (HONS. SCHOOL) FIRST SEMESTER FOR STUDENTS OF PHYSICS MAJOR FOR THE EXAMINATION 2012-2013.

PHYS 111H  MECHANICS  (45 hrs.)  Max. Marks: 75

Objective: This course has been so framed that the students are first exposed to the mathematical tools needed in Mechanics and Special Relativity. Students are then taught the topics of conservation laws, elastic and inelastic scattering, dynamics of rigid bodies and inverse-square law of forces in the framework of Newtonian Mechanics.

Note:

1. The question paper for the final examination will consist of 7 questions including one compulsory question covering the whole syllabus. There will be no choice in the compulsory question. The candidate will attempt five questions in all including compulsory question. All Questions will carry equal marks viz. 12.
2. The question paper is expected to contain problems with a weightage of 25 to 40%.
3. The books indicated as recommended books are suggestive of the level of coverage. However, other books may be followed.

Mathematical Tools: Differentiation : Basic ideas, the chain rule, implicit differentiation, special points of a function. Differential Equations: First degree first order equations, exact differentials, integrating factor, second order homogeneous and non-homogeneous differential equations with constant coefficients, complementary solutions and particular integral. Integration: As area under the curve and inverse of differentiation, simple examples, integration by substitution and by parts, reduction formulae, integration in plane polar coordinates. Vectors : Basics, vector addition, products of vectors (Scalar and Vector), reciprocal vectors, vector derivatives, circular motion, vectors and spherical polar coordinates, invariants. (Ch 1 & 6 of Book 1, Ch. II of Book 2, Ch. 2 and 3 of Book 3).

Conservation Laws: Conservation of Energy, Conservative forces, Internal forces and conservation of linear momentum, Centre of mass, systems with variable mass, Space-Vehicle Problem. Conservation of Angular Momentum, Internal torques, Angular Momentum about the Centre of mass, Rotational invariance, Shape of Galaxy. (Chs. V and VI of Book 2, Ch. 5 of Book 3).

Elastic and Inelastic Scattering: Types of scattering and conservation laws, Laboratory and centre of mass systems, collision of particles which stick together, General elastic collision of particles of different mass, Cross-section of elastic scattering, Rutherford scattering. (Ch. VI of Book 1, Ch. 7 of Book 2).

Dynamics of Rigid Bodies: Equation of motion, angular momentum and kinetic energy of a Rotating Body, Moment of Inertia and Radius of Gyration, Rotation of about fixed axes - time dependence of motion, cylinder on an accelerated rough plane, Behaviour of angular momentum vector, Principal axes and Euler’s equations. Elementary Gyroscope, Symmetrical Top. (Ch.VIII of Book 2, Ch. 8 of Book 3).

Inverse-Square-Law of Forces: Force between a Point Mass and Spherical shell. Force between a Point Mass and Solid Sphere, Gravitational and Electrostatic self-energy. Gravitational energy of the Galaxy and of uniform sphere; Orbits and their eccentricity, Two-body problem - reduced mass. (Ch. IX of Book 2, Ch. 6 of Book 3).

TUTORIALS: Relevant problems given at the end of a chapter in books 1, 2 and 3.

Books
Objective: The aim of this course is to teach the students basics of electronics and electric current after making them comfortable with the mathematical tools involved in the study of electricity and magnetism.

Note:
1. The question paper for the final examination will consist of 7 questions including one compulsory question covering the whole syllabus. There will be no choice in the compulsory question. The candidate will attempt five questions in all including compulsory question. All Questions will carry equal marks viz. 12.
2. The question paper is expected to contain problems with a weightage of 25 to 40%.
3. The books indicated as recommended books are suggestive of the level of coverage. However, other books may be followed.

Mathematical Tools : Complex Numbers : Real and imaginary parts, complex plane, polar representation, conjugation, algebraic operations, Euler’s formula, power and roots of complex numbers, exponential and trigonometric functions, hyperbolic functions, logarithms, inverse functions. Vector Calculus : Differentiation of vectors, scalar and vector fields, conservative fields and potentials, line integrals, gradient of a scalar field, divergence of a vector field and divergence theorem, curl of a vector field and its physical significance, Stokes’ theorem, combination of grad, div and curl. (Ch 2, 6, 8 of Book 1; Ch 1,3,5 of Book 2, Ch 1, 2 of Book 3)

Electric Charges and Fields : Conservation and quantization of charge, Coulomb’s Law, Energy of a system of charges. Flux and Gauss’s law. Brief review of electric fields of a spherical charge distribution, a line charge and an infinite flat charged sheet. (Ch. 1 of Book 3).

Electric Potential : Potential as line integral of field, potential difference, Gradient of a scalar function, Derivation of the field from the potential, potential of a charge distribution, Uniformly charged disc. Force on a surface charge, energy associated with an electric field, Gauss’s theorem and differential form of Gauss’s law, Laplacian and Laplace’s equation, Poisson’s equation. (Ch. 2 of Book 3).

Electric Fields Around Conductors : Conductors and insulators, General electrostatic problem. Boundary conditions, Uniqueness theorem, some simple system of conductors; capacitors and capacitance, Energy stored in a capacitor. (Ch. 3 of Book 3).

Electric Currents : Charge transport and current density, Stationary currents, Ohm’s law, Electrical conduction model, Failure of Ohm’s law, Circuits and circuit elements, Energy dissipation in current flow, variable currents in capacitors and resistors. (Ch. 4 of Book3).

Tutorials : Relevant problems given at the end of each chapter in books 1,2 and 3.

Books :
Objective: The laboratory exercises have been so designed that the students learn to verify some of the concepts learnt in the theory courses. They are trained in carrying out precise measurements and handling sensitive equipments.

Note:
1. Examination time will be 3½ hours. Internal assessment will be based on day to day performance of the students in the laboratory, viva voice of each experiment, regularity in the class, number of experiments performed etc.
2. Eight to ten experiments are to be performed in each Semester. Experiments performed in odd semester can not be repeated in even semester.

1. Analysis of experimental data by:
   (i) Fitting of given data to a straight line.
   (ii) Calculation of probable error. Use of Vernier callipers, screw gauge and spherometer.
2. To study the variation of time period with distance between centre of suspension and centre of gravity for a bar pendulum and to determine:
   (i) Radius of gyration of the bar about an axis through its C.G. and perpendicular to its length.
   (ii) The value of g in the laboratory.
3. To determine the Young's modulus by bending of beam.
4. To determine the coefficient of rigidity of a wire by static method or Maxwell's needle.
5. To study one dimensional collision using two hanging spheres of different materials.
6. Dependence of scattering angle on kinetic energy and impact parameter in Rutherford scattering (mechanical analogue).
7. To measure the coefficient of linear expansion.
9. To study the magnetic field produced by a current carrying solenoid using a pick-up coil and to find the value of permeability of air.
10. To determine the frequency of a.c. main using sonometer.
11. To study given source of electrical energy and verify the maximum power theorem.
12. To determine the resistance of an electrolyte for a.c current and study its concentration dependence.
13. To study the dependence of resistance on temperature.
14. To measure thermo e.m.f. using potentiometer.
15. To study C.R.O. as display and measuring device by recording sines and square waves, output from a rectifier, verification (qualitative) of law of electromagnetic induction and frequency of a.c. mains.
16. To plot the Lissajous figures and determine the phase angle by C.R.O.
17. To study B-H curves for different ferromagnetic materials using C.R.O.
18. Determination of given inductance by Anderson's bridge.
19. To determine the value of an air capacitance by de-Sauty Method and to find permittivity of air. Also to determine the dielectric constant of a liquid.
20. Study of R.C. circuit with varying e.m.f. using it as an integrating circuit.
22. Studies based on LCR Board: Impedance of LCR circuit and the phase and between voltage and current.
23. To determine the wavelength of LASER using diffraction grating and use it for the determination of the grating element of another grating.
Objective: This course aims at exposing the students to Newton’s law of motion, the Galilean transformations and Einstein’s special theory of relativity in proper perspective so that they can use its formulation in later courses.

Note:  
1. The question paper for the final examination will consist of 7 questions including one compulsory question covering the whole syllabus. There will be no choice in the compulsory question. The candidate will attempt five questions in all including compulsory question. All Questions will carry equal marks viz. 12.  
2. The question paper is expected to contain problems with a weightage of 25 to 40%.  
3. The books indicated as recommended books are suggestive of the level of coverage. However, other books may be followed.

Newton's Laws of Motion: Forces and equations of motion, Lorentz force, Motion of a charged particle in a uniform constant magnetic field, charged particle in a uniform alternating electric field. (Ch. III of Book 2, Ch. 4 of Book 3).

Galilean Transformation: Inertial reference frames, absolute and relative accelerations and velocity, Galilean Transformation, Conservation of Momentum, Fictitious Forces, Collisions, Velocity and Acceleration in Rotating coordinate systems. (Ch. IV of Book 2, Ch. 10 of Book 3).

Lorentz Transformations: Michelson-Morley Experiment, Basic postulates of special relativity, Lorentz transformations, Simultaneity and causality in relativity. Length contraction, Time dilation, Velocity Transformation, Space-like and time-like intervals, Aberration of light, Doppler effect. (Ch. XI of Book 2, Ch. 11 of Book 3).

Problems in Relativistic Dynamics: Acceleration of Charged Particle by constant longitudinal electric field, Acceleration by a Transverse Electric field, charged particle in a magnetic field, centre of mass system and Threshold Energy. Energy available from Moving charge, Antiproton Threshold, Photoproduction of mesons. (Ch. XIII of Book 2, Ch. 12 of Book 3).

TUTORIALS: Relevant problems given at the end of a chapter in books 1, 2 and 3.

Books

Objective: The course on Electricity & Magnetism-II has been designed to make the students confident about electric fields in matter, the fields of moving charges, magnetic fields in vacuum as well as matter, the physics of electromagnetic induction and alternating currents so that they can use this knowledge in electric and condense matter physics

Note:
1. The question paper for the final examination will consist of 7 questions including one compulsory question covering the whole syllabus. There will be no choice in the compulsory question. The candidate will attempt five questions in all including compulsory question. All Questions will carry equal marks viz. 12.
2. The question paper is expected to contain problems with a weightage of 25 to 40%.
3. The books indicated as recommended books are suggestive of the level of coverage. However, other books may be followed.

Electric Fields in Matter: Dielectrics, Moments of a charge distribution, Potential and field of a dipole, Atomic and molecular dipoles, Induced dipole moments, Permanent dipole moments, electric field caused by polarized matter, field of a polarized sphere, dielectric sphere in a uniform field, Gauss’s law and a dielectric medium, Electrical susceptibility and atomic polarizability, Energy changes in polarization, Polarization in changing fields. (Ch. 10 of Book 3).

The Fields of Moving Charges: Magnetic forces, Measurement of a charge in motion, invariance of charge, Electric field measured in different frames of reference, Field of a point charge moving with constant velocity, Field of a charge that starts or stops, Force on a moving charge, Interaction between a moving charge and other moving charges. (Ch. 5 of Book 3).

Magnetic Field: Definition, some properties of the magnetic field, Vector potential, Field of current carrying wire and solenoid, change in \( B \) at a current sheet; Transformations of electric and magnetic fields. Rowland’s experiment, Hall effect. (Ch 6 of Book 3).

Electromagnetic Induction: Universal law of induction, Mutual inductance, Reciprocity theorem, Self inductance, Energy stored in a Magnetic field. A circuit containing self inductance, Displacement current and Maxwell’s equations. (Ch. 7 and 9 of Book 3).

Alternating Current Circuits: A resonance circuit, Alternating current, A.C. networks, Admittance and impedance, skin effect, power and energy in A.C. circuits, Anderson’s Bridge, Q factor for series resonance. (Ch. 8 of Book 3).

Magnetic Fields in Matter: Response of various substances to magnetic field, Force on a dipole in an external field, Electric currents in Atoms, Electron spin and Magnetic moment, types of magnetic materials, Magnetic susceptibility. (Ch. 11 of Book 3).

Tutorials: Relevant problems given at the end of each chapter in books 1,2 and 3.

Books
Objective: The laboratory exercises have been so designed that the students learn to verify some of the concepts learnt in the theory courses. They are trained in carrying out precise measurements and handling sensitive equipments.

Note:
1. Examination time will be 3½ hours. Internal assessment will be based on day to day performance of the students in the laboratory, viva voice of each experiment, regularity in the class, number of experiments performed etc.
2. Eight to ten experiments are to be performed in each Semester. Experiments performed in odd semester can not be repeated in even semester.

1. Analysis of experimental data by:
   (i) Fitting of given data to a straight line.
   (ii) Calculation of probable error. Use of Vernier callipers, screw gauge and spherometer.
2. To study the variation of time period with distance between centre of suspension and centre of gravity for a bar pendulum and to determine:
   (i) Radius of gyration of the bar about an axis through its C.G. and perpendicular to its length.
   (ii) The value of g in the laboratory.
3. To determine the Young's modulus by bending of beam.
4. To determine the coefficient of rigidity of a wire by static method or Maxwell's needle.
5. To study one dimensional collision using two hanging spheres of different materials.
6. Dependence of scattering angle on kinetic energy and impact parameter in Rutherford scattering (mechanical analogue).
7. To measure the coefficient of linear expansion.
9. To study the magnetic field produced by a current carrying solenoid using a pick-up coil and to find the value of permeability of air.
10. To determine the frequency of a.c. main using sonometer.
11. To study given source of electrical energy and verify the maximum power theorem.
12. To determine the resistance of an electrolyte for a.c current and study its concentration dependence.
13. To study the dependence of resistance on temperature.
14. To measure thermo e.m.f. using potentiometer.
15. To study C.R.O. as display and measuring device by recording sines and square waves, output from a rectifier, verification (qualitative) of law of electromagnetic induction and frequency of a.c. mains.
16. To plot the Lissajous figures and determine the phase angle by C.R.O.
17. To study B-H curves for different ferromagnetic materials using C.R.O.
18. Determination of given inductance by Anderson's bridge.
19. To determine the value of an air capacitance by de-Sauty Method and to find permittivity of air. Also to determine the dielectric constant of a liquid.
20. Study of R.C. circuit with varying e.m.f. using it as an integrating circuit.
22. Studies based on LCR Board: Impedance of LCR circuit and the phase and between voltage and current.
23. To determine the wavelength of LASER using diffraction grating and use it for the determination of the grating element of another grating.
Objective: This course has been framed to teach the students the elements of Newtonian mechanics, simple damped and forced oscillations and propagation of waves in physical media.

Note:
1. The question paper for the final examination will consist of three sections. Sections A and B of the paper will have three questions each from the corresponding sections of the syllabi and section C will have one compulsory question covering the whole syllabus. There will be no choice in the compulsory question. The candidate will attempt five questions in all, selecting two questions each from sections A and B and compulsory question from section C. All Questions will carry equal marks viz. 12.
2. The question paper is expected to contain problems with a weightage of 25 to 40%.
3. The books indicated as recommended books are suggestive of the level of coverage. However, other books may be followed.

SECTION A: MECHANICS

Vector Algebra and Co-ordinate Systems: Review of vector operations, rectangular Cartesian coordinate system, spherical polar coordinates, two dimensional displacement, velocity and acceleration. (Book I)

Particle Dynamics: Dynamical concepts- mechanics of a system of particles. (4.2,4.3 of Book I).

Conservation laws and Properties of space and time: Conservation of linear and angular momenta, homogeneity of flow of time. (Book 1)

Elastic and Inelastic Scattering: Types of scattering and conservation laws, Laboratory and centre of mass systems, collision of particles which stick together, General elastic collision of particles of different mass, Cross-section of elastic scattering, Rutherford scattering. (Book 1).

Frames of Reference and Relativity: Definitions, inertial reference frames, coordinate transformations within reference frame, Newtonian mechanics and principle of relativity, Galilean transformations, origin and significance of the special theory of relativity, search of a universal frame of reference, postulates of the special theory of relativity, Lorentz transformations and their kinematical consequences, intervals, space-like and time-like, variation of mass with velocity, mass energy equivalence, Particles with zero rest mass. (Book 1).

SECTION B: WAVES

Simple Harmonic Free Vibrations: Simple harmonic motion, energy of a SHO, Compound pendulum, Electrical Oscillations, Transverse Vibrations of a mass on a string, composition of two perpendicular SHMs of same period and of periods in ratio 1:2, Anharmonic Oscillations. (Book 2)

Damped Simple Harmonic Vibrations: Decay of free Vibrations due to damping, types of damping, Determination of damping coefficients – Logarithmic decrement, relaxation time and Q-factor. Electromagnetic damping. (Book 2)

Forced Vibrations and Resonance: A forced oscillator, Transient and Steady State Oscillations, velocity versus driving force frequency, Resonance, power supplied to forced oscillator by the driving force. Q-factor of a forced oscillator, Electrical, nuclear and nuclear-magnetic resonances. (Book 2)

Waves in Physical Media: Wave motion in one dimension, Transverse and longitudinal waves, progressive harmonic waves and their energy, Transverse waves on a string, longitudinal waves on a rod, characteristic impedance of a string, waves in an absorbing medium, spherical waves. (Book 2)

Books
Objective: The aim of the laboratory exercises is to train the students in handling the equipments, verifying some laws they study in theory and making them confident to perform precise measurements.

Note:
1. Examination time will be 3 hours. Internal assessment will be based on day to day performance of the students in the laboratory, viva voice of each experiment, regularity in the class, number of experiments performed etc.
2. Eight to ten experiments are to be performed in each Semester. Experiments performed in odd semester can not be repeated in even semester. Exercises (i) and (ii) are compulsory for all students in first semester.

(i) Analysis of experimental data by Fitting of given data to a straight line.
(ii) Calculation of probable error. Use of vernier calipers, screw gauge and spherometer and other measuring instruments, Barometer.

1. Determination of ‘g’ by bar pendulum.
2. Determination of ‘g’ by Kater's pendulum.
4. To determine Young's modulus of material of a bar by bending method.
5. Determination of modulus of rigidity by torsional pendulum.
6. Determination of coefficient of viscosity of a given liquid by Stoke's method.
7. Determination of coefficient of linear expansion.
8. Determination of thermal conductivity of a bad conductor by Lee’s Disc method.
9. Determination of Stefan's constant.
10. Determination of focal length of convex mirror by beam compass method.
11. Determination of magnifying power of a telescope by slit method.
12. Determination of resolving power of a telescope.
13. Determination of frequency of A.C. mains by using electrical vibrator.
15. To determine the wave-length of laser light using a plane diffraction grating.
17. Determination of specific rotation of sugar using a Polarimeter.
18. Study of one dimensional collisions.
19. Determination of height (of inaccessible structure) using sextant.
PHYSICS SYLLABUS FOR B.SC. (HONS. SCHOOL) SECOND SEMESTER SUBSIDIARY FOR
STUDENTS OF CHEMISTRY, COMPUTER SCIENCE, GEOLOGY AND MATHEMATICS FOR THE
EXAMINATION 2012-2013.

PHYS 121S : OPTICS AND THERMAL PHYSICS (50 hrs.) Max. Marks: 75

Objective: The syllabus has been framed keeping in mind the needs of the students of basic medical sciences in their later training.

Note: 1. The question paper for the final examination will consist of three sections. Sections A and B of the paper will have three questions each from the corresponding sections of the syllabi and section C will have one compulsory question covering the whole syllabus. There will be no choice in the compulsory question. The candidate will attempt **five** questions in all, selecting **two** questions each from sections A and B and compulsory question from section C. All Questions will carry equal marks viz. 12.

2. The question paper is expected to contain problems with a weightage of 25 to 40%.

3. The books indicated as recommended books are suggestive of the level of coverage. However, other books may be followed.

**Section A: Optics**

**Interference**: Young's experiment, coherent sources, phase and path differences, Theory of interference fringes, Fresnel's biprism, sheet thickness determination, interference in thin films due to reflected and transmitted lights, Maxima and minima in intensities, Colours of thin films, Newton's rings and its various aspects, Non-reflecting films. (Book 1).

**Diffraction**: Introduction, rectilinear propagation, Fresnel and Fraunhofer diffraction, Diffraction at a circular aperture and straight edge and their discussion. Fraunhofer diffraction at a single slit and a double slit. Fraunhofer diffraction at N slits and its discussion. Plane diffraction grating and its theory, Dispersive power of grating, Resolving power of optical instruments, Rayleigh criterion, Resolving power telescope, microscope, prism and diffraction grating. Phase contrast microscope. (Book 1).

**Polarization**: Introduction, Polarization by reflection, Brewester's law, Polarization by refraction, Malus's law, Double refraction, Nicol Prism and its use, elliptically and Circularly polarized light, quarter and half-wave plates, production and detection of plane, circularly and elliptically polarized light, optical activity, specific rotation, Half-shade polarimeter. (Book 1).

**Spectrum**: Mercury and sodium lamps, spectra and their classifications, infrared and ultra-violet spectra, Zeeman effect, Stark effect, Raman effect. (Book 1).

**Laser and Holography**: Brief features of laser, holography and fibre optics. (Book 1).

**Section B: Thermal Physics**

**Statistical Physics**: Scope of statistical physics, micro and macrostates, thermodynamic probability distribution of n particles in two compartments, deviation from the state of maximum probability; equilibrium state of dynamic system, distribution of distinguishable particles in compartments and cells, phase space and its division into cells, Boltzmann statistics for ideal gas, Bose-Einstein statistics and its application to black body radiation, Fermi-Dirac statistics and its application to electron gas, comparison of the three statistics. (Book 2).

**Thermodynamics**: Statistical basis of entropy, Change of entropy of a system, third law of thermodynamics, additive nature of entropy, law of increase of entropy, reversible and irreversible processes, increase of entropy in some natural processes, entropy of a perfect gas. Maxwell's relationships and their applications, cooling produced by adiabatic expansion, adiabatic compression, Cp-Cv, Clapeyron equation, Joule-Thomson effect and its thermodynamic treatment for Van der Waal's gas and Joule-Thomson cooling, Liquefication of helium. [Book 2]

**Books**
Objective: The aim of the laboratory exercises is to train the students in handling the equipments, verifying some laws they study in theory and making them confident to perform precise measurements.

Note:

1. Examination time will be 3 hours. Internal assessment will be based on day to day performance of the students in the laboratory, viva voice of each experiment, regularity in the class, number of experiments performed etc.
2. Eight to ten experiments are to be performed in each Semester. Experiments performed in odd semester cannot be repeated in even semester. Exercises (i) and (ii) are compulsory for all students in first semester.

(i) **Analysis of experimental data by** Fitting of given data to a straight line.
(ii) **Calculation of probable error.** Use of vernier calipers, screw gauge and spherometer and other measuring instruments, Barometer.

1. Determination of ‘g’ by bar pendulum.
2. Determination of ‘g’ by Kater's pendulum.
4. To determine Young's modulus of material of a bar by bending method.
5. Determination of modulus of rigidity by torsional pendulum.
6. Determination of coefficient of viscosity of a given liquid by Stoke's method.
7. Determination of coefficient of linear expansion.
8. Determination of thermal conductivity of a bad conductor by Lee’s Disc method.
9. Determination of Stefan's constant.
10. Determination of focal length of convex mirror by beam compass method.
11. Determination of magnifying power of a telescope by slit method.
12. Determination of resolving power of a telescope.
13. Determination of frequency of A.C. mains by using electrical vibrator.
15. To determine the wave-length of laser light using a plane diffraction grating.
17. Determination of specific rotation of sugar using a Polarimeter.
18. Study of one dimensional collision.
19. Determination of height (of inaccessible structure) using sextant.
PHYSICS SYLLABUS FOR B.SC. (H.S.) I SEMESTER SUBSIDIARY FOR BIOCHEMISTRY, BIOPHYSICS, BIOTECH. AND MICROBIOLOGY FOR THE EXAM. 2012-2013

PHYS 113S: ELECTRICITY, MAGNETISM AND ELECTRONICS 50 hrs
Max Marks : 75

Objective: This course has been designed for the students of basic medical sciences so that after learning the basic features of electricity and magnetism, they get sufficient exposure to the electronics that can enable them to understand the working of electronic equipment used in their fields of specialization.

Note:
1. The question paper for the final examination will consist of three sections. Sections A and B of the paper will have three questions each from the corresponding sections of the syllabi and section C will have one compulsory question covering the whole syllabus. There will be no choice in the compulsory question. The candidate will attempt five questions in all, selecting two questions each from sections A and B and compulsory question from section C. All Questions will carry equal marks viz. 12.
2. The question paper is expected to contain problems with a weightage of 25 to 40%.
3. The books indicated as recommended books are suggestive of the level of coverage. However, other books may be followed.

SECTION- A

Vector Analysis: Vectors and Vector properties, Components of Vectors, Unit Vectors, Product of Vectors. (1.7, 1.8, 1.9, 1.10)

Gauss law: Charges & Electric Flux and calculations, Gauss’s Law, Electric Potential Energy and Potential Gradient. (22.1, 22.2, 22.3, 22.4, 23.1, 23.2, 23.5)

Magnetism: magnetism, magnetic field, Magnetic field lines and flux, motion of charges particle in Magnetic field, Bio-Savart law, Ampere law, Magnetic Materials, Faraday’s Law, Maxwell equations (27.1, 27.2, 27.3, 27.4, 28.2, 28.6, 28.7, 28.8, 29.2, 29.7)

SECTION- B

Dielectric: Dielectric and Gauss’s Law in Dielectric (24.4, 24.6)

Electromotive Forces: Electromotive force & Circuits, Mutual Inductance, Self Induction and Inductors (25.4, 30.1, 30.2)

Conduction in Semiconductors: Electrons and holes in semiconductor, carrier concentration, donor and acceptor impurities, charge densities, Fermi Level in semiconductors, diffusion, carrier lifetimes, continuity equation (Book 2)

Diode Characteristics: Qualitative theory of p-n junction, p-n diode, band structure of an open circuit diode, current components, qualitative theory of diode currents, V-I Characteristics. (Book 2)

Transistors: Junction Transistors, Transistor current components, transistor as an amplifier, C B and C E configuration (Book 2)

Applications: Half Wave rectifier, ripple factor, full wave rectifier, filters, photoconductivity, Photodiodes (Book 2)

Books
2. Fundamentals of Physics, Resnick & Hlleday, 8th Edition (Wiley)
Objective: The exercises included in this laboratory course are aimed at training the students to handle different type of equipment for verification of some of the laws studied in theory and for carrying out precise measurements so that they develop confidence to use later the sophisticated instruments in their respective fields.

Note:
1. Examination time will be 3 hours. Internal assessment will be based on day to day performance of the students in the laboratory, viva voice of each experiment, regularity in the class, number of experiments performed etc.
2. Eight to ten experiments are to be performed in each Semester. Experiments performed in odd semester can not be repeated in even semester. Exercises (i) and (ii) are compulsory for all students in first semester.

(i) Analysis of experimental data by Fitting of given data to a straight line.
(ii) Calculation of probable error. Use of vernier calipers, screw gauge and spherometer and other measuring instruments, Barometer.

1. Determination of wavelength of laser light by a plane diffraction grating.
3. Determination of specific rotation of sugar by Polarimeter.
4. Determination of refractive index of prism for different wave lengths using spectrometer.
5. Self-inductance by Anderson's bridge.
6. Capacitance by de Sauty method.
7. Verification of laws of electromagnetic induction.
8. Verification of Rutherford- Soddy nuclear decay formula - mechanical analogue.
9. To find half-life period of a given radio-active substance using GM counter/ Characteristics of GM Counter
10. Study of C.R.O. as display and measuring device, Study of Sine-wave, square wave signals (half wave and full wave rectification)
13. Determination of Stefan's constant.
15. Study of one dimensional Collision.
17. Determination of $E_g$ in Si and Ge.
18. Study of Ge, Si, LED, diode characteristics.
19. To study the variation of the resistance of filament of bulb with its temperature.
20. Study of common base transistor characteristics.
21. Study of common emitter transistor characteristics.
22. Determination of ‘e’ or ‘(e/m)’ of an electron.
24. Determination of Planck's constant using photocell.
25. Determination of velocity of ultrasonic waves in a given liquid.
26. Study of vacuum triode characteristics.
PHYSICS SYLLABUS FOR B.SC. (HONS. SCHOOL) SECOND SEMESTER SUBSIDIARY FOR STUDENTS OF BIOCHEMISTRY, BIOPHYSICS, BIOTECHNO-LOGY AND MICROBIOLOGY FOR THE EXAMINATION 2012-2013.

PHYS 123S : OPTICS AND MODERN PHYSICS (50hrs) Max Marks : 75

Objective: This course has been framed keeping in mind the requirements of the students with respect to the concepts of physical optics and quantum mechanics as used in different branches of basic medical sciences.

Note:
1. The question paper for the final examination will consist of three sections. Sections A and B of the paper will have three questions each from the corresponding sections of the syllabi and section C will have one compulsory question covering the whole syllabus. There will be no choice in the compulsory question. The candidate will attempt five questions in all, selecting two questions each from sections A and B and compulsory question from section C. All Questions will carry equal marks viz. 12.
2. The question paper is expected to contain problems with a weightage of 25 to 40%.
3. The books indicated as recommended books are suggestive of the level of coverage. However, other books may be followed.

SECTION A: Optics

Interference: Young's experiment, coherent sources, phase and path differences, Theory of interference fringes, Fresnel's biprism, sheet thickness determination, interference in thin films due to reflected and transmitted lights, Maxima and minima in intensities, Colours of thin films, Newton's rings and its various aspects. (Book 1)

Polarization: Introduction, Polarization by reflection and refraction, Brewester's law, Malus's law, Double retraction, Nicol Prism and its use, elliptically and circularly polarized light, quarter and half-wave plates, production and detection of plane, circularly and elliptically polarized light, optical activity, specific rotation, Half-shade polarimeter. (Book 1).

Laser and Holography: Brief features of laser, holography and fibre optics. (Book 1).

SECTION B: MODERN PHYSICS

Particle Properties of Waves: Quantum theory of light, X-ray diffraction, Compton effect, pair production, Photons and gravity, black holes. (Book2).

Wave Properties of Particles: de Broglie waves, waves of probability, the wave equation, phase and group velocities, particle diffraction, electron microscope, uncertainty principle. (Book2).

Quantum Mechanics: Wave function and wave equation, Schrodinger equation -time-dependent and steady state forms, expectation value. Particle in a box, Schrodinger's equation for hydrogen atom, separation of variables, quantum numbers. (Book 2).

Books
Objective: The exercises included in this laboratory course are aimed at training the students to handle different type of equipment for verification of some of the laws studied in theory and for carrying out precise measurements so that they develop confidence to use later the sophisticated instruments in their respective fields.

Note:
1. Examination time will be 3 hours. Internal assessment will be based on day to day performance of the students in the laboratory, viva voice of each experiment, regularity in the class, number of experiments performed etc.
2. Eight to ten experiments are to be performed in each Semester. Experiments performed in odd semester can not be repeated in even semester. Exercises (i) and (ii) are compulsory for all students in first semester.

(iii) Analysis of experimental data by Fitting of given data to a straight line.
(iv) Calculation of probable error. Use of vernier calipers, screw gauge and spherometer and other measuring instruments, Barometer.

1. Determination of wavelength of laser light by a plane diffraction grating.
3. Determination of specific rotation of sugar by Polarimeter.
4. Determination of refractive index of prism for different wave lengths using spectrometer.
5. Self-inductance by Anderson's bridge.
6. Capacitance by de Sauty method.
7. Verification of laws of electromagnetic induction.
8. Verification of Rutherford-Soddy nuclear decay formula - mechanical analogue.
9. To find half-life period of a given radio-active substance using GM counter/ Characteristics of GM Counter
10. Study of C.R.O. as display and measuring device, Study of Sine-wave, square wave signals (half wave and full wave rectification)
13. Determination of Stefan's constant.
15. Study of one dimensional Collision.
17. Determination of $E_g$ in Si and Ge.
18. Study of Ge, Si, LED, diode characteristics.
19. To study the variation of the resistance of filament of bulb with its temperature.
20. Study of common base transistor characteristics.
21. Study of common emitter transistor characteristics.
22. Determination of ‘e’ or ‘$(e/m)$’ of an electron.
23. Study of Solar-Cell characteristics
24. Determination of Planck's constant using photocell.
25. Determination of velocity of ultrasonic waves in a given liquid
26. Study of vacuum triode characteristics.
SYLLABUS FOR B.Sc. (HONS. SCHOOL) IN PHYSICS THIRD SEMESTER (MAJOR) FOR THE EXAMINATION 2012-2013.

PHYS 211H : VIBRATIONS AND WAVES (45 hrs.)

Max. Marks: 75

Note:

1. The question paper for the final examination will consist of 7 questions including one compulsory question covering the whole syllabus. There will be no choice in the compulsory question. The candidate will attempt five questions in all including compulsory question. All Questions will carry equal marks viz. 12.
2. The question paper is expected to contain problems with a weightage of 25 to 40%.
3. The books indicated as recommended books are suggestive of the level of coverage. However, other books may be followed.

I Simple Harmonic Free Vibrations: Simple harmonic motion, energy of a SHO, Compound pendulum, Electrical Oscillations, Plasma Vibrations, Lattice Vibrations, Transverse Vibrations of a mass on a string, composition of two perpendicular SHMs of same period and of periods in ratio 1:2, Anharmonic Oscillations.

III Forced Vibrations and Resonance: A forced oscillator, Transient and Steady State Oscillations, velocity versus driving force frequency, Resonance, power supplied to forced oscillator by the driving force. Q-factor of a forced oscillator, Electrical, nuclear and nuclear-magnetic resonances.

IV Coupled Oscillations: Stiffness coupled oscillators, Normal coordinates and modes of vibrations. Normal frequencies, Forced vibrations and resonance for coupled oscillators, Masses on string-coupled oscillators.

V Waves in Physical Media: Wave motion in one dimension, Transverse and longitudinal waves, progressive harmonic waves and their energy, Transverse waves on a string, longitudinal waves on a rod, Electrical transmission lines, characteristic impedance of a string and a transmission line, waves in an absorbing medium, spherical waves.

VI Reflection and Transmission: Reflection and transmission of transverse waves on a string at the discontinuity, Energy considerations of reflected and transmitted waves, Impedance matching, eigenfrequencies and eigenfunctions for stationary waves on a string. Normal modes in three dimensions, Planck’s Law, Debye’s $T^3$ Law, Conduction electrons in a metal, transmission of non-monochromatic waves, Bandwidth Theorem.

TUTORIALS: Relevant Problems on the topics covered in the course.

Books:

PHYS 212H: QUANTUM MECHANICS AND STATISTICAL PHYSICS  
(45 hrs.)  
Max. Marks: 75

Note:
1. The question paper for the final examination will consist of 7 questions including one compulsory question covering the whole syllabus. There will be no choice in the compulsory question. The candidate will attempt five questions in all including compulsory question. All Questions will carry equal marks viz. 12.
2. The question paper is expected to contain problems with a weightage of 25 to 40%.
3. The books indicated as recommended books are suggestive of the level of coverage. However, other books may be followed.

I Mathematical Tools: Partial differentiation: Definition of partial derivative, total differentiation, exact and inexact differentials, useful theorems, the chain rule, change of variables, stationary values under constraints, Lagrange multipliers, differentiation of integrals.

II Origin of the Quantum Theory: Blackbody radiation, the photoelectric effect, the Franck-Hertz experiment, the correspondence principle, the Bohr atom, quantization of the phase integral, the particle in a box, the rigid rotator, the harmonic oscillator.

III Foundations of Wave Mechanics: Photons as particles: the Compton effect, particle diffraction, elements of Fourier Analysis, Parseval’s formula and the Fourier integral theorem, examples of Fourier transforms, superposition of plane waves and time dependence, wave packets and the Einstein-de Broglie relations, wave functions for a free particle and the Schrodinger equation, physical interpretation of the Schrodinger wave function.

IV Basic Ideas of Statistical Physics: Introduction, Basic ideas of probability and their applications, Macrostates and microstates, Effect of constraints on the system. Distribution of n particles in two compartments, deviation from the state of maximum probability, Equilibrium state of a dynamic system, distribution of N distinguishable particles in unequal compartments, Division into cells.

TUTORIALS: Relevant Problems given at the end of chapters in books 1 - 4.

Books
6. Introduction to Quantum Mechanics, 2nd edition, D.J. Griffiths (Pearson)
PHYS 213H: ELECTRONICS AND NETWORK THEORY-I

(45 hrs.)

Max. Marks: 75

Note:

1. The question paper for the final examination will consist of 7 questions including one compulsory question covering the whole syllabus. There will be no choice in the compulsory question. The candidate will attempt five questions in all including compulsory question. All Questions will carry equal marks viz. 12.

2. The question paper is expected to contain problems with a weightage of 25 to 40%.

3. The books indicated as recommended books are suggestive of the level of coverage. However, other books may be followed.

Semiconductor Materials and Diode Junctions: Band diagram, Mobility and conductivity, generation and recombination of charges, Diffusion, Continuity equation, Diode equation, V-I characteristics, temperature dependence, Transition and diffusion capacitance, Zener diode, Light emitting diode, various kinds of Transducers.

Transistors: pnp and npn junction transistors, transistor current components, CB, CC and CE configurations, transfer characteristics, Transistor as switch and applications, Transistor biasing, fixed bias, emitter-stabilised biasing, Voltage-divider biasing, Junction FET, v-i Characteristics.

Waveshaping Circuits: Clipping and Clamping circuits, Diode and transistor clippers, Clamping circuits, Clamping circuit theorem.

Power Supplies: Characteristics, Rectifiers, Filter circuits, efficiency, Ripple factor, voltage multiplying circuits, Regulation, Shunt and Series regulators, Monolithic regulators (Introduction)

TUTORIALS: Relevant problems given at the end of chapters in the books.

Books

1. Pulse, Digital and Switching Waveforms : J. Millman and H. Taub ( Tata Mcgraw Hill)
2. Integrated Electronics : J. Millman and C.C.Halkias( Tata Mcgraw Hill)
3. Linear and Non-linear Circuits : Chua, Desoer and Kuh.
PHYS 214H        PHYSICS LABORATORY               (90 hrs.)

Max. Marks: 75

Note:
1. Examination time will be 4 hours. Internal assessment will be based on day to day performance of the students in the laboratory, viva voice of each experiment, regularity in the class, number of experiments performed etc.
2. Seven to nine experiments are to be performed in each Semester. Experiments performed in odd semester can not be repeated in even semester.

1. To determine Cauchy’s constants and resolving power of a given prism.
2. To find the refractive index of a given liquid using a prism spectrometer.
3. To determine the wavelength of sodium light using Newton’s rings method.
4. To find the resolving power and magnification of a telescope.
5. To find the resolving power and magnification of a diffraction grating.
6. To study the variation of specific rotation of sugar solution with concentration.
7. Determination of mechanical equivalent of heat by Calendar and Barne’s constant flow method.
8. To measure the thermal conductivity of a conductor.
9. To determine the value of Stefan’s Constant.
10. To determine thermal conductivity of a bad conductor disc by Lees and Chorlton method.
11. To draw the characteristics of a given triode and to determine the tube parameters.
12. To determine energy gap of a given semiconductor.
13. Study of characteristics of a thermistor and thermocouple and to calibrate it for temperature measurements.
14. To measure low resistance by Kelvin’s double bridge/ Carey Foster’s bridge.
15. Forward and reverse characteristics of different diodes. Use of zener diode for voltage regulation.
16. To study ripple factor for a half-wave and a full-wave rectifier without and with different filters.
17. To study common emitter characteristics of a given transistor and to determine various parameters.
18. To study common base characteristics of a given transistor and to determine various parameters.
19. To study the induced emf as a function of the velocity of magnet and to study the phenomenon of electromagnetic damping.
20. To study the variation of magnetic field with distance along axis of a circular coil – realization of Helmholtz’s coils.
21. To determine charge to mass ratio (e/m) of an electron by helical method using CRT.
22. Verification of laws of probability and radioactivity (mechanical analogue).
23. To find the first ionization potential of mercury.

Compulsory exercises on fabrication etc. utilizing workshop facility-
Wood/Metal/Electronics  (Students will submit the report on these exercises which are equivalent to one experiment).
SYLLABUS FOR B.Sc. (HONS. SCHOOL) IN PHYSICS FOURTH SEMESTER (MAJOR) FOR THE EXAMINATION 2012-2013.

PHYS 221H : ELECTROMAGNETIC THEORY (45 hrs.)
Max. Marks: 75

Note:
1. The question paper for the final examination will consist of 7 questions including one compulsory question covering the whole syllabus. There will be no choice in the compulsory question. The candidate will attempt five questions in all including compulsory question. All Questions will carry equal marks viz. 12.
2. The question paper is expected to contain problems with a weightage of 25 to 40%.
3. The books indicated as recommended books are suggestive of the level of coverage. However, other books may be followed.

I Electromagnetic Waves: Maxwell’s equations, wave equation, e.m. waves in a medium with finite \(\varepsilon\) and \(\mu\). Plane waves, Energy flux due to a plane e.m. wave, Wave-impedance of a medium to e.m. waves, e.m. waves in a conducting medium – skin depth and impedance of a conductor. Reflection and Transmission of e.m. waves at the boundary of two dielectric media - impedance and refractive index, e.m. theory of dispersion.

II Polarization: Polarization of plane harmonic waves, linear, circular and elliptical polarization, natural light, production of polarized light, Malus’ law, polarization by scattering, Birefringence, quarter-wave and half-wave plates. Double refraction, Nicol prism, analysis of circularly and elliptically polarized light.

III Interference: Light vector, coherence, theory of interference. Young’s double slit experiment, Fresnel’s Biprism, displacement of fringes, fringes with white light, Stoke’s law, interference in thin films, non-reflecting films, Newton’s rings and applications, Michelson’s interferometer—principle, theory and applications, Fabry-Perot interferometer and etalon, Interference filters.

TUTORIALS : Relevant Problems on the topics covered in the course.

Books

PHYS 222H THERMODYNAMICS (45 hrs.)

Max. Marks: 75

Note:

1. The question paper for the final examination will consist of 7 questions including one compulsory question covering the whole syllabus. There will be no choice in the compulsory question. The candidate will attempt five questions in all including compulsory question. All Questions will carry equal marks viz. 12.
2. The question paper is expected to contain problems with a weightage of 25 to 40%.
3. The books indicated as recommended books are suggestive of the level of coverage. However, other books may be followed.

I Statistical Basis of Entropy: Definition of entropy, change of entropy of a system, third law of thermodynamics. Additive nature of entropy, law of increase of entropy, reversible and irreversible processes and their examples, work done in a reversible process, Increase of entropy in some natural processes, entropy and disorder.

II Entropy and Carnot’s Engine: Review of terms used in thermodynamics and of Carnot’s Heat Engine, Entropy changes in Carnot’s cycle, Carnot’s theorem, Thermodynamic temperature scale, Third law, Thermoelectric effect and its thermodynamical analysis, change of entropy along a reversible path in P-V diagram, entropy of a perfect gas, equation of state of an ideal gas, Heat death of Universe.

III Maxwell’s Thermodynamic Relations: Perfect differentials in Thermodynamics, Maxwell Relationships, cooling produced by adiabatic expansion, adiabatic compression, adiabatic stretching of wires and thin films, change of internal energy with volume, $C_p-C_v$, variation of $C_v$ with volume, Clapeyron’s equation. Second-order phase transitions. Thermodynamic equilibrium of a heterogeneous system. Application of phase rule to systems with one or more components.

IV Production of Low Temperature: Joule-Thomson effect and its thermodynamic treatment, Joule-Thomson effect for a Vander Waal’s gas, Production of very low temperatures by adiabatic demagnetization, Measurement of very low temperatures.

V Specific Heat of Gases: Specific Heats of monoatomic and diatomic gases, Energy due to rotation and its variation, quantization of rotational motion, contribution of rotational energy to specific heat, quantization of vibrational motion, contribution of vibrational energy to specific heat, specific heat of diatomic gases.

TUTORIALS: Relevant Problems given at the end of chapters in books 1 and 2.

Books

PHYS 223H     ELECTRONICS AND NETWORK THEORY-II     (45 hrs.)
Max. Marks: 75

Note:
1. The question paper for the final examination will consist of 7 questions including one compulsory question covering the whole syllabus. There will be no choice in the compulsory question. The candidate will attempt five questions in all including compulsory question. All Questions will carry equal marks viz. 12.
2. The question paper is expected to contain problems with a weightage of 25 to 40%.
3. The books indicated as recommended books are suggestive of the level of coverage. However, other books may be followed.

Circuit Theory: Miller’s theorem, Maximum Power Transfer Theorem, Series and parallel connection of mutually coupled coil, Equivalent circuit of transformer, Impedance transformer and power relationship.

Transistor Amplifiers and Oscillators:
Transistor hybrid model, Analysis of Transistor amplifier circuit using h-parameters, Comparison of transistor amplifier configurations, Simplified common-emitter hybrid model, Common emitter amplifier with an emitter resistance, Classification of amplifiers, distortion in amplifiers, RC-coupled amplifier, Feedback in amplifiers, different types, voltage gain, advantages, emitter follower as –ve feedback circuit, FET amplifier configurations, operational amplifier characteristics and applications.

Barkhausen criterion of sustained oscillations, LC oscillator, Hartley oscillator, RC oscillators, Phase-shift and Wein bridge oscillators.

Logic Circuits: Logic systems, Circuits for OR, AND, NOT gates, transistor switching times, Exclusive OR gate, De Morgan’s laws.

Communication: Modulation and detection, AM, FM, Radio wave propagation, Radio transmitter and receiver, TV receiver, Pulse Modulation, Modem.

TUTORIALS: Relevant problems given at the end of chapters in the books.

Books
1. Pulse, Digital and Switching Waveforms : J. Millman and H. Taub ( Tata Mcgraw Hill)
2. Integrated Electronics : J. Millman and C.C.Halkias( Tata Mcgraw Hill)
3. Linear and Non-linear Circuits : Chua, Desoe and Kuh.
PHYS 224H          PHYSICS LABORATORY          (90 hrs.)

Max. Marks: 75

Note:

a. Examination time will be 4 hours. Internal assessment will be based on day to day performance of the students in the laboratory, viva voice of each experiment, regularity in the class, number of experiments performed etc.

b. Seven to nine experiments are to be performed in each Semester. Experiments performed in odd semester can not be repeated in even semester.

1. To determine Cauchy’s constants and resolving power of a given prism.
2. To find the refractive index of a given liquid using a prism spectrometer.
3. To determine the wavelength of sodium light using Newton’s rings method.
4. To find the resolving power and magnification of a telescope.
5. To find the resolving power and magnification of a diffraction grating.
6. To study the variation of specific rotation of sugar solution with concentration.
7. Determination of mechanical equivalent of heat by Calendar and Barne’s constant flow method.
8. To measure the thermal conductivity of a conductor.
9. To determine the value of Stefan’s Constant.
10. To determine thermal conductivity of a bad conductor disc by Lees and Chorlton method.
11. To draw the characteristics of a given triode and to determine the tube parameters.
12. To determine energy gap of a given semiconductor.
13. Study of characteristics of a thermistor and thermocouple and to calibrate it for temperature measurements.
14. To measure low resistance by Kelvin’s double bridge/ Carey Foster’s bridge.
15. Forward and reverse characteristics of different diodes. Use of zener diode for voltage regulation.
16. To study ripple factor for a half-wave and a full-wave rectifier without and with different filters.
17. To study common emitter characteristics of a given transistor and to determine various parameters.
18. To study common base characteristics of a given transistor and to determine various parameters.
19. To study the induced emf as a function of the velocity of magnet and to study the phenomenon of electromagnetic damping.
20. To study the variation of magnetic field with distance along axis of a circular coil – realization of Helmholtz’s coils.
21. To determine charge to mass ratio (e/m) of an electron by helical method using CRT.
22. Verification of laws of probability and radioactivity (mechanical analogue).
23. To find the first ionization potential of mercury.

Compulsory exercises on fabrication etc. utilizing workshop facility- Wood/Metal/Electronics (Students will submit the report on these exercises which are equivalent to one experiment).
PHYSICS SYLLABUS FOR B.SC. (HONS. SCHOOL) THIRD SEMESTER SUBSIDIARY FOR STUDENTS OF CHEMISTRY, COMPUTER SCIENCE, GEOLOGY AND MATHEMATICS FOR THE EXAMINATION 2012-2013.

PHYS 211S: ELECTRICITY, MAGNETISM AND ELECTRONICS (50 Hrs) Max. Marks: 75

Note:

1. The question paper for the final examination will consist of three sections. Sections A and B of the paper will have three questions each from the corresponding sections of the syllabi and section C will have one compulsory question covering the whole syllabus. There will be no choice in the compulsory question. The candidate will attempt five questions in all, selecting two questions each from sections A and B and compulsory question from section C. All Questions will carry equal marks viz. 12

2. The question paper is expected to contain problems with a weightage of 25 to 40%.

3. The books indicated as recommended books are suggestive of the level of coverage. However, other books may be followed.

Sections- A

I. Vector Analysis: Review of vector algebra, vector differentiation, vector integration, Gauss’s divergence and Stoke’s theorems and their physical significance.

II. Electrostatics: Coulomb’s law, superposition principle, field concept, scalar potential, Energy considerations, relation between field and potential, use of Gauss’s law to calculate electric field, electric field due to a uniform line charge, surface charge, spherical shell of charge, the electric dipole.

III. Dielectrics: The polarization density, polarization charge density, \( D = \varepsilon_0 E + P \)

IV. Current Electricity: Current as moving charge, The Biot-Savart law, some properties of B, Ampere’s law, the magnetic dipole, the solenoid, magnetic vector and scalar potential, charged particle in magnetic field, charged particle in electric and magnetic fields, Faraday’s law of electromagnetic induction, different mechanisms for change of flux, motional emf, mutual inductance, self inductance.

V. Magnetic field in material media: Types of magnetic substances, magnetization, \( B = \mu_0 (M + H) \), Boundary conditions on \( B \) and \( H \), Hysteresis curve.

VI. Maxwell’s Equations: Displacement current, Maxwell’s equations, Poynting vector.

VII. Some Applications: Electrostatic deflection in a cathode ray tube, Cathode ray oscilloscope, G M Counter.

Sections - B

VIII. Conduction in semiconductors: Electrons and holes in an semiconductor, carrier concentration, donor and acceptor impurities, charge densities, Fermi level in semiconductors, diffusion, carrier lifetimes, continuity equation.

IX. Diode characteristics: qualitative theory of p-n junction, p-n diode, band structure of an open circuit diode, current components, quantitative theory of diode currents, V-I characteristics, transition capacitance, diffusion capacitance.

X. Transistor: Junction transistor, transistor current components, transistor as an amplifier, C B and C E configurations

XI. Low frequency transistor model: The port device and hybrid model, transistor hybrid model, transistor as amplifier using h- parameters, comparison of transistor amplifier configurations.

XII. Applications: Half wave rectifier, ripple factor, full wave rectifier, inductor and capacitor filters, regulated power supply, oscillators (introduction only), photoconductivity, photodiode.

Books

PHYS 212S: PHYSICS LABORATORY

Max. Marks: 25

Note:
1. Examination time will be 3½ hours. Internal assessment will be based on day to day performance of the students in the laboratory, viva voce of each experiment, regularity in the class, number of experiments performed etc.
2. Eight to ten experiments are to be performed in each Semester. Experiments performed in odd semester can not be repeated in even semester.

List of experiments:
1. Verification of maximum power theorem.
2. Self-inductance by Anderson's bridge.
3. Capacitance of air capacitor and dielectric capacitor by de Sauty method.
4. To calibrate the wire of Carey Foster bridge and hence determine the resistance of two turns of a tangent galvanometer.
5. To study the concentration dependence of the resistance electrolyte.
6. To study dependence of magnetic field in a solenoid on various parameters and hence to evaluate $\Phi_0$.
7. Study of common base transistor characteristics.
8. Study of common emitter transistor characteristics.
9. To study the variation of the resistance of filament of bulb with its temperature.
10. Determination of high resistance by substitution method.
11. Comparison of e.m.f. of two cells by Lumsden’s method.
12. Study of C.R.O. as display and measuring device, Study of Sine-wave, square wave signals (half wave and full wave rectification).
14. Study of B-H curve of various materials using CRO.
15. Verification of Rutherford- Soddy nuclear decay formula - mechanical analogue.
16. To find half-life period of a given radio-active substance using GM counter.
17. Determination of Planck’s constant using photocell.
19. Determination of ionization potential of mercury.
20. Verification of laws of electromagnetic induction.
21. To determine ECE of hydrogen.
22. Determination of $E_g$ in Si and Ge.
23. Determination of charge on an electron.
24. Study of Ge, Si, LED diode characteristics.
25. Study of vacuum triode characteristics.
PHYSICS SYLLABUS FOR B.SC. (HONS. SCHOOL) FOURTH SEMESTER SUBSIDIARY FOR STUDENTS OF CHEMISTRY, COMPUTER SCIENCE, GEOLOGY AND MATHEMATICS FOR THE EXAMINATION 2012-2013.

PHYS 221S: MODERN PHYSICS          (50 Hrs)          Max. Marks: 75

Note:
1. The question paper for the final examination will consist of three sections. Sections A and B of the paper will have three questions each from the corresponding sections of the syllabi and section C will have one compulsory question covering the whole syllabus. There will be no choice in the compulsory question. The candidate will attempt five questions in all, selecting two questions each from sections A and B and compulsory question from section C. All Questions will carry equal marks viz. 12.
2. The question paper is expected to contain problems with a weightage of 25 to 40%.
3. The books indicated as recommended books are suggestive of the level of coverage. However, other books may be followed.

Section A
I. Particle Properties of Waves: Quantum theory of light, X-rays and their diffraction, Compton effect, pair production. photons and gravity, black holes.

II. Wave Properties of Particles: de Broglie waves, waves of probability, the wave equation, phase and group velocities, particle diffraction, uncertainty principle and its applications.

III. Quantum Mechanics: Difference between classical and quantum mechanics, wave function and wave equations. Schrodinger's equation, time dependent and steady state forms, Expectation values, particle in a box, reflection and transmission by a barrier, tunnel effect, harmonic oscillator.

Section B
V. Many Electron Atoms: Electron spin, spin-orbit coupling, identical particles, exclusion principle, symmetric and antisymmetric wave functions, electron configurations, total angular momentum, L.S. coupling, jj coupling, one electron spectra, two electron spectra, X-ray spectra.

VI. The Atomic Nucleus: Do nuclei contain electrons? The neutron, stable nuclei, nuclear sizes and shapes, binding energy, liquid drop model, shell model, meson theory of nuclear forces. Radioactivity: Radioactive decay, Half-life, radioactive dating, radioactive series, alpha decay and its theory, beta decay, gamma-decay, radiation hazards and radiation units.

VII. Nuclear Reactions: Reaction cross-section, neutron thermalization, nuclear reactions, c.m. system, nuclear fission, nuclear reactors, breeder reactors, nuclear fusion in stars, fusion reactors.

VIII. Elementary Particles: Interaction of charged particles, gamma ray absorption, particle detection, leptons, hadrons, elementary particle quantum numbers, isospin, symmetries and conservation principles, Quarks, fundamental interactions.

Book
PHYS 222S: PHYSICS LABORATORY

Max. Marks: 25

Note:
1. Examination time will be 3½ hours. Internal assessment will be based on day to day performance of the students in the laboratory, viva voice of each experiment, regularity in the class, number of experiments performed etc.
2. Eight to ten experiments are to be performed in each Semester. Experiments performed in odd semester can not be repeated in even semester.

List of experiments:
1. Verification of maximum power theorem.
2. Self-inductance by Anderson's bridge.
3. Capacitance of air capacitor and dielectric capacitor by de Sauty method.
4. To calibrate the wire of Carey Foster bridge and hence determine the resistance of two turns of a tangent galvanometer.
5. To study the concentration dependence of the resistance electrolyte
6. To study dependence of magnetic field in a solenoid on various parameters and hence to evaluate $\mu_0$.
7. Study of common base transistor characteristics.
8. Study of common emitter transistor characteristics.
9. To study the variation of the resistance of filament of bulb with its temperature.
10. Determination of high resistance by substitution method.
11. Comparison of e.m.f. of two cells by Lumsden’s method.
12. Study of C.R.O. as display and measuring device, Study of Sine-wave, square wave signals (half wave and full wave rectification).
14. Study of B-H curve of various materials using CRO.
15. Verification of Rutherford- Soddy nuclear decay formula - mechanical analogue.
16. To find half-life period of a given radio-active substance using GM counter.
17. Determination of Planck's constant using photocell.
19. Determination of ionization potential of mercury.
20. Verification of laws of electromagnetic induction.
21. To determine ECE of hydrogen.
22. Determination of $E_g$ in Si and Ge.
23. Determination of charge on an electron.
24. Study of Ge, Si, LED diode characteristics.
25. Study of vacuum triode characteristics.
OUTLINES OF TESTS, SYLLABI AND COURSES OF READING FOR B. Sc. (HONS SCHOOL) IN PHYSICS – FIFTH AND SIXTH SEMESTER EXAMINATION 2012-2013.

PHYS 311H: MATHEMATICAL PHYSICS (45 hrs.)

Max. Marks: 75

Note

1. The question paper for the final examination will consist of 7 questions including one compulsory question covering the whole syllabus. There will be no choice in the compulsory question. The candidate will attempt five questions in all including compulsory question. All questions will carry equal marks, viz. 12.

2. The question paper is expected to contain problems with a weightage of 25 to 40%.

3. The books indicated as recommended books are suggestive of the level of coverage. However, other books may be followed.

II. Infinite Series: Fundamental concepts, convergence tests, alternating series, algebra of series, power series, Taylor series.

IV. Multiple Integrals: Double and triple integrals, application of multiple integrals, change of variables in integrals, general properties of Jacobians, surface and volume integrals.

V. Statistics and Probability: Statistical distributions, second moments and standard deviations, definition of probability, fundamental laws of probability, discrete probability distributions, combinations and permutations, continuous distributions – expectation, moments and standard deviation, Binomial, Poisson and Gaussian distributions, applications to experimental measurement.

Tutorials: Relevant problems given in books 1 – 4.

Recommended Books

Note:
1. The question paper for the final examination will consist of 7 questions including one compulsory question covering the whole syllabus. There will be no choice in the compulsory question. The candidate will attempt five questions in all including compulsory question. All Questions will carry equal marks viz. 12.
2. The question paper is expected to contain problems with a weightage of 25 to 40%.
3. The books indicated as recommended books are suggestive of the level of coverage. However, other books may be followed.

I. Introduction: Introduction, monochromaticity, temporal and spatial coherence, Einstein’s coefficients, momentum transfer, possibility of light amplification, kinetics of optical absorption, shape and width of spectral lines, line broadening mechanism, natural, collision and Doppler broadening.

II. Laser Pumping and Resonators: Resonators, modes of a resonator, number of modes per unit volume, open resonators, confocal resonator (qualitative), quality factor, losses inside the cavity, threshold condition, quantum yield.

III. Dynamics of the Laser Processes: Rate equations for two, three and four level systems, production of a giant pulse – Q switching, giant pulse dynamics, laser amplifiers, mode-locking, hole burning, distributed feedback lasers.

V. Applications: Holography, non-linear optics: harmonic generation, second harmonic generation, phase matching and optical mixing, brief qualitative description of some experiments of fundamental importance.

TUTORIALS: Problems pertaining to the topics covered in the course.

Books:
4. Laser Theory and Applications : Thyagarajan and A. Ghatak (MacMillan)
Note:
1. The question paper for the final examination will consist of 7 questions including one compulsory question covering the whole syllabus. There will be no choice in the compulsory question. The candidate will attempt five questions in all including compulsory question. All Questions will carry equal marks viz. 12.
2. The question paper is expected to contain problems with a weightage of 25 to 40%.
3. The books indicated as recommended books are suggestive of the level of coverage. However, other books may be followed.

I. Solids and Crystal Structure: General definitions of Lattice, basis and primitive cell, Symmetry operations, Bravais lattices in two and three dimensions, Index system for crystal planes, resume of common lattice types (sc, fcc, bcc, hcp, diamond, NaCl, CsCl & ZnS structures), fcc & hcp structures as stacking, Structures of insulators and metals, radius ratio rules and Pauling’s principles.

II. Reciprocal Lattice and X-ray Diffraction: Reciprocal Lattice, Miller indices, Brillouin zone of sc, fcc and bcc lattices, Experimental diffraction methods, Bragg diffraction, scattered wave amplitude: atomic form factor, structure factor of simple structures (sc, fcc, bcc, hcp, diamond, NaCl, CsCl & ZnS), Neutron and electron diffraction methods, Temperature dependence of reflection lines.

III. Crystal Binding: Cohesive energy and bulk modulus in inert gas and ionic crystal, Binding in metallic, covalent and H-bonded crystals (basic ideas only).

IV. Lattice Vibrations: Dynamics of monatomic and diatomic linear chains, optical and acoustic modes, concept of phonons, inelastic scattering of photons and neutrons by phonons, density of states (one & Three dimensions) Einstein and Debye models of heat capacity, thermal expansion.

V. Free Electron Fermi Gas: Review of statistical mechanics of Fermi Gas of non-interacting electrons, heat capacity of electron gas, electrical conductivity, Ohm’s Law, Hall effect, thermal conductivity and Pauli Paramagnetism.

VI. Band Theory: Bloch functions, Kronig-Penney model, Qualitative ideas of bands in metals, semi-metals, semiconductors and insulators, Fermi surface-basic idea with square lattice as an example.

TUTORIALS: Relevant problems on the topics covered in the course.

Books
1. Introduction to Solid State Physics : C. Kittel (Wiley, VII ed.)
Note:
1. The question paper for the final examination will consist of 7 questions including one compulsory question covering the whole syllabus. There will be no choice in the compulsory question. The candidate will attempt five questions in all including compulsory question. All Questions will carry equal marks viz. 12.
2. The question paper is expected to contain problems with a weightage of 25 to 40%.
3. The books indicated as recommended books are suggestive of the level of coverage. However, other books may be followed.

I. Nuclear properties: Constituents of nucleus, non-existence of electrons in nucleus, Nuclear mass and binding energy, features of binding energy versus mass number curve, nuclear radius, angular momentum and parity, qualitative discussion of two-body nuclear forces, nuclear moments, magnetic dipole moment and electric quadrupole moment.

II. Radioactive decays: Modes of decay of radioactive nuclides and decay Laws, chart of nuclides and domain of instabilities, Radioactive dating, constituents of Cosmic rays. Beta decays: $\beta^-$, $\beta^+$ and electron capture decays, allowed and forbidden transitions (selection rules), parity violation in $\beta$-decay. Alpha decay: Stability of heavy nuclei against break up, Geiger-Nuttal law, barrier penetration as applied to alpha decay, reduced widths, deducing nuclear energy levels. Gamma transitions: Excited levels, isomeric levels, gamma transitions, multipole moments, selection rules, transition probabilities, internal conversion (IC), determination of multipolarity from $\gamma\gamma$-correlation and IC measurements.

III. Nuclear reactions: Types of nuclear reactions, reactions cross section, conservation laws, Kinematics of nuclear reaction, Q-value and its physical significance, compound nucleus.

IV. Nuclear Models: Liquid drop model, semi-empirical mass formula, condition of stability, Fermi gas model, evidence for nuclear magic numbers, Shell model, energy level scheme, angular momenta of nuclear ground states.

TUTORIALS: Relevant problems on the topics covered in the course.

Books:
1. Basic ideas and Concepts in Nuclear Physics by K. Hyde
2. Introduction to Nuclear Physics; H.A. Enge
3. Nuclear Physics: I. Kaplan (Addison Wesley)
4. Nuclei and Particles by E. Segre
Note:

1. The question paper for the final examination will consist of 7 questions including one compulsory question covering the whole syllabus. There will be no choice in the compulsory question. The candidate will attempt five questions in all including compulsory question. All Questions will carry equal marks viz. 12.
2. The question paper is expected to contain problems with a weightage of 25 to 40%.
3. The books indicated as recommended books are suggestive of the level of coverage. However, other books may be followed.

II. Production of Low Pressures: Pump types, Gaede oil-sealed rotating vane pump, Diffusion pump, sputter-ion pumps, Gettering, types of getters, Cryogenic pumps.

IV. Methodology of Vacuum systems: Materials for vacuum system, cleaning and sealing of vacuum system, Leak detection and its location.

V. Production and Measurement of Low Temperatures: Adiabatic throttling of gases, liquefaction of H₂ and He, Solidification of He. Liquid He II, Thermodynamics of λ-transition, Adiabatic demagnetization, Temperatures below 0.01K, Low temperature thermometry.

VI. Some Systems at Low Temperatures: Low temperature technique, Use of liquid air and other liquified gases, Superfluidity in He II, Bose-Einstein Condensation in atomic clouds. LASER cooling and trapping of atoms, Superconductivity.

TUTORIALS: Relevant problems on the topics covered in the course.

Books

1. Vacuum Technology: A. Roth (North Holland)
2. Handbook of High Vacuum Techniques: H.A. Steinherz (Reinhold Pub.)
4. Low Temperature Physics: C. Dewitt, B. Dreyfus and P.G. de Gennes (Gordon & Breach)
PHYS 316H: PHYSICS LABORATORY (135 hrs.)
Max. Marks: 125

Note:

a. Examination time will be 4 hours. Internal assessment will be based on day to day performance of the students in the laboratory, viva voice of each experiment, regularity in the class, number of experiments performed etc.

b. Seven to nine experiments are to be performed in each Semester. Experiments performed in odd semester can not be repeated in even semester.

1. Design of constant current supply. This is a compulsory exercise for all students.
2. To study the dependence of energy transfer on the mass ratio of the colliding bodies, using air track.
3. To verify the law of conservation of linear momentum in collision with initial momentum zero, using air track.
4. To measure the coupling factor between two pendulums and study its dependence on coupling mass and distance of coupling threads from the axes of oscillation.
5. To study the dependence of frequency of normal modes and their difference in a coupled oscillator on coupling mass.
6. To study the given L.C.R. circuit and find its Q factor for different resistances.
7. To study the characteristics of given voltage doubler and tripler.
8. To study the clipping and clamping circuits.
9. To study the frequency response of given RC coupled transistor amplifier and determine its band width.
10. To determine the distributed capacity of given inductance coil.
11. To determine the given capacitance using flashing and quenching of a neon bulb.
12. To determine the operating plateau and dead time of a given G.M. Counter.
13. To measure magnetic susceptibility of FeCl$_2$ solution by Quincke’s method.
14. To find conductivity of given semiconductor crystal using four probe method.
15. To study the characteristics of silicon and GaAs solar cells.
16. To study astable multivibrator.
17. Study of excitations of a given atom by Franck Hertz set up.
18. To study attenuation coefficient of an optical fibre.
19. To study intensity response of a photo resistor.
20. To study cooling curve of a binary alloy.
21. To determine the velocity of ultrasonic waves in liquids, by diffraction of light method.
22. To study the amplitude modulation.
23. To study high energy interactions in nuclear emulsion. Energy of a star.
24. Random sampling of an alternating current source, simulation and probabilistic observations.
25. To study the characteristics of LED and photodiode.
26. To study of magneto-resistance of a given sample.
27. Determination of dissociation limit of iodine molecule by constant deviation spectrograph
28. Study of emission spectrum of given samples (Fe, Cu etc).
29. To determine the Hall coefficient and mobility of given semiconductors.
30. To determine the heat capacity of given materials
31. Characteristics of UJT and its application as a relaxation oscillator.
Note
1. The question paper for the final examination will consist of 7 questions including one compulsory question covering the whole syllabus. There will be no choice in the compulsory question. The candidate will attempt five questions in all including compulsory question. All questions will carry equal marks, viz. 12.
2. The question paper is expected to contain problems with a weightage of 25 to 40%.
3. The books indicated as recommended books are suggestive of the level of coverage. However, other books may be followed.

I. Wave packets and the uncertainty principle: Uncertainty of position and momentum – exact statement and proof, energy-time uncertainty, Gaussian wave packet and its spread with time, general solution for time dependence of $\psi$, causality.

II. The Schrödinger Equation: Interaction among particles, analogy between optics and mechanics, superposition principle, probability current, motion of wave packets, Ehrenfest’s theorem.

III. Problems in one dimension: Potential step, potential barrier, rectangular potential well, degeneracy, linear independence, Sturm’s theorem, bound states, orthogonality, linear harmonic oscillator, oscillator wave function, parity.

IV. Operators and Eigenfunctions: Linear operators, operator formalism in quantum mechanics, orthogonal systems, expansion in eigenfunctions, Hermitian operators, commutation rule and uncertainty principle, equation of motion, parity operator.

Tutorials: Relevant problems given in books 1 – 5.

Recommended Books
1. Quantum Mechanics, J.L. Powell and B. Crasemann (Narosa, 1995)
2. Introduction to Quantum Mechanics, D.J. Griffiths (Pearson, 2005)
5. Quantum Mechanics, F. Schwabl (Narosa, 1995)
Note:
1. The question paper for the final examination will consist of 7 questions including one compulsory question covering the whole syllabus. There will be no choice in the compulsory question. The candidate will attempt five questions in all including compulsory question. All Questions will carry equal marks viz. 12.
2. The question paper is expected to contain problems with a weightage of 25 to 40%.
3. The books indicated as recommended books are suggestive of the level of coverage. However, other books may be followed.

II. Alkali-like Spectra: General features, doublet structure, Larmor’s theorem and magnetic levels, elementary theory of weak and strong magnetic fields, Zeeman effect in doublet spectra: anomalous Zeeman effect and the anomalous g-value.

III. Pauli’s principle and shell structure: Systems with several electrons and spin functions.

IV. Complex Spectra: LS-Coupling scheme, normal triplets, basic assumptions of the theory, identification of terms, selection rules, jj- coupling (Qualitative).

V. Infrared and Raman Spectra: Rigid rotator, energy levels, spectrum (no derivation of selection rules), Harmonic oscillator: energy levels, eigenfunctions, spectrum, comparison with observed spectrum, Raman effect, Quantum theory of Raman effect, Rotational and Vibrational Raman spectrum. Anharmonic oscillator: energy levels, Infrared and Raman Spectrum, Vibrational frequency and force constants. Non-rigid rotator: energy levels, spectrum, Vibrating-rotator energy levels, Infrared and Raman spectrum (no derivation of Dunham coefficients), Symmetry properties of rotational levels, influence of nuclear spin.

TUTORIALS: Problems pertaining to the topics covered in the course.

Books
5. Molecular Spectroscopy: S. Chandra (Narosa, 2009)
Note:
1. The question paper for the final examination will consist of 7 questions including one compulsory question covering the whole syllabus. There will be no choice in the compulsory question. The candidate will attempt five questions in all including compulsory question. All Questions will carry equal marks viz. 12.
2. The question paper is expected to contain problems with a weightage of 25 to 40%.
3. The books indicated as recommended books are suggestive of the level of coverage. However, other books may be followed.

II. Crystal Imperfections: Point, line, surface and volume imperfections, dislocations and their geometry, Disorder in polymers and non-crystalline materials.

III. Phase Diagrams: Phase rule, Single component systems, Binary phase diagrams, Lever rule, phases in polymers, non-crystalline and crystalline phases. Non-equilibrium in phase diagrams, Cu-Zn system, Fe-C alloys, Ceramic Systems, Other applications of phase diagrams.

IV. Phase Transformations: Time scale for phase changes, Nucleation kinetics, Growth of nuclei and solidification of alloys, Transformations in steel, Precipitation processes, Glass Transition; Recovery, recrystallization and grain growth.

VI. Fracture: Ductile fracture, Brittle fracture, Fracture toughness, Ductile-brittle transition, Protection against fracture, Fatigue fracture.

TUTORIALS: Relevant problems on the topics covered in the course.

Books:
1. Introduction to Solid State Physics: C. Kittel (Wiley, VII ed.)
5. Materials Science and Engineering: V. Raghvan (Prentice Hall)
Note:
1. The question paper for the final examination will consist of 7 questions including one compulsory question covering the whole syllabus. There will be no choice in the compulsory question. The candidate will attempt five questions in all including compulsory question. All Questions will carry equal marks viz. 12.
2. The question paper is expected to contain problems with a weightage of 25 to 40%.
3. The books indicated as recommended books are suggestive of the level of coverage. However, other books may be followed.

I. Interaction of radiation and charged particles with matter: Energy loss of electrons and positrons, Positron annihilation in condensed media, Stopping power and range of heavier charged particles, derivation of Bethe-Bloch formula, interaction of gamma rays with matter.

II. Nuclear radiation detection: Gas-filled detectors, proportional and Geiger-Muller counters, Scintillation detectors, solid-state detectors, Cherenkov effect, calorimeter-electromagnetic and hadron, specialized detectors, solid state nuclear track detectors, bubble chambers, nuclear emulsions.

III. Accelerators: Accelerators, linear accelerators, cyclic accelerators, ion sources, focussing, stability, electron synchrotron, colliding beam machines, particle beams for fixed target experiments, CERN Super Proton Synchrotron (SPS) and Fermilab Tevatron.

IV. Elementary Particles: Historical introduction, fermions and bosons, particles and antiparticles, Classification of particles, types of interactions, electromagnetic, weak, strong interactions, gravitational interactions, Quantum numbers and conservation laws, isospin, charge conjugation, Yukawa theory, Introduction to quarks and qualitative discussion of the quark model, high energy physics units.

V. Particle Properties and their reactions: Properties and life time of muon, pions: Determination of mass, spin and parity. Lifetime of neutral pion and isotopic spin. Strange particles: V particles, charged K-mesons, mass and life time for charged K-mesons. Observations of different strange particles ($\Lambda^0$, $\Sigma^0$, $\Sigma^\pm$, $\Xi^0$, $\Xi^+$, $\Omega$), strange particle production and decay. Strangeness and Hypercharge.

TUTORIALS: Relevant problems on the topics covered in the course.

Books:
1. Basic ideas and Concepts in Nuclear Physics by K. Hyde
2. Introduction to Nuclear Physics : H.A. Enge
3. Nuclear Physics : I. Kaplan (Addison Wesley)
4. Nuclei and Particles by E. Segre
5. Introduction to High energy Physics by D.H. Perkins
Note:
1. The question paper for the final examination will consist of 7 questions including one compulsory question covering the whole syllabus. There will be no choice in the compulsory question. The candidate will attempt five questions in all including compulsory question. All Questions will carry equal marks viz. 12.
2. The question paper is expected to contain problems with a weightage of 25 to 40%.
3. The books indicated as recommended books are suggestive of the level of coverage. However, other books may be followed.

II. Mossbauer Spectroscopy: Spectral line-shape of γ-rays, Recoilless emission of γ-rays, Resonance fluorescence and nuclear gamma resonance, Mossbauer spectrum – Isomer shift, Quadrupole splitting, Magnetic hyperfine structure, Combined electric and magnetic hyperfine splitting, line intensity, line width. Mossbauer spectrometer, Applications.

IV. Nuclear Magnetic Resonance: Quantum mechanical description of NMR; The Bloch equation and its solutions – free precession; steady state in weak r.f. field, in-phase and out-of-phase susceptibilities, power absorption; Saturation effects at high radio-frequency power; intense r.f. pulses. Fourier Transform NMR. The NMR spectrum – Chemical shift, spin-spin coupling. NMR spectrometer. Applications.

V. Other Resonance Phenomena: Nuclear quadrupole resonance and its applications, Ferromagnetic resonance – shape effects and applications.

TUTORIALS: Relevant problems on the topics covered in the course.

Books
**Note:**

a. Examination time will be 4 hours. Internal assessment will be based on day to day performance of the students in the laboratory, viva voice of each experiment, regularity in the class, number of experiments performed etc.

b. Seven to nine experiments are to be performed in each Semester. Experiments performed in odd semester can not be repeated in even semester.

1. Design of constant current supply. This is a compulsory exercise for all students.
2. To study the dependence of energy transfer on the mass ratio of the colliding bodies, using air track.
3. To verify the law of conservation of linear momentum in collision with initial momentum zero, using air track.
4. To measure the coupling factor between two pendulums and study its dependence on coupling mass and distance of coupling threads from the axes of oscillation.
5. To study the dependence of frequency of normal modes and their difference in a coupled oscillator on coupling mass.
6. To study the given L.C.R. circuit and find its Q factor for different resistances.
7. To study the characteristics of given voltage doubler and tripler.
8. To study the clipping and clamping circuits.
9. To study the frequency response of given RC coupled transistor amplifier and determine its bandwidth.
10. To determine the distributed capacity of given inductance coil.
11. To determine the given capacitance using flashing and quenching of a neon bulb.
12. To determine the operating plateau and dead time of a given G.M. Counter.
13. To measure magnetic susceptibility of FeCl$_2$ solution by Quincke’s method.
14. To find conductivity of given semiconductor crystal using four probe method.
15. To study the characteristics of silicon and GaAs solar cells.
16. To study astable multivibrator.
17. Study of excitations of a given atom by Franck Hertz set up.
18. To study attenuation coefficient of an optical fibre.
19. To study intensity response of a photo resistor.
20. To study cooling curve of a binary alloy.
21. To determine the velocity of ultrasonic waves in liquids, by diffraction of light method.
22. To study the amplitude modulation.
23. To study high energy interactions in nuclear emulsion. Energy of a star.
24. Random sampling of an alternating current source, simulation and probabilistic observations.
25. To study the characteristics of LED and photodiode.
26. To study of magneto-resistance of a given sample.
27. Determination of dissociation limit of iodine molecule by constant deviation spectrograph.
28. Study of emission spectrum of given samples (Fe, Cu etc).
29. To determine the Hall coefficient and mobility of given semiconductors.
30. To determine the heat capacity of given materials.
31. Characteristics of UJT and its application as a relaxation oscillator.
